The Effect Of PLISSIT Model Counselling On Sexual Function Of Married Women With HIV

Protocol summary

Summary

The purpose of this randomized clinical trial is to examine the effect of counseling based on PLISSIT model on sexual function of women with HIV. The statistical population of this research includes all the Married women who go to Imam Khomeini Hospital of Tehran to receive routine care for HIV. This study will be on 60 Married women who are positive HIV, and who are qualified to participate for this research. The main inclusion criteria involves: HIV-positive married women and having an intact marriage; HIV-negative husband; Passing at least 3 months of HIV diagnosis in person; Do not use alcohol and drugs; No addiction; lack of mental and chronic physical illness; and the main exclusion criteria involves: If a woman does not want to continue take parting in this study or becomes pregnant. After taking a written testimonial, the researcher asked the qualified women to fill the questionnaires of demographic information, FSFI and Beck Depression questionnaires. Randomly the participants are assigned to two groups of intervention and control. In the intervention group, participants will be counseling based on PLISSIT model on sexual function of women. The control group will receive routine care for HIV . Training session will be held once a week. Data will be collected from participants at three points: before consultation, 1 months and 3 months after consultation.
