The effect of expiratory rib - cage compression before endotracheal suctioning on arterial blood oxygenation mechanically ventilated patients

Protocol summary

2012-05-21, 1391/03/01

Summary

Background & Aim: In patients undergoing mechanical ventilation because of an endotracheal tube, mucus production and secretion is high. Because endotracheal suction in these patients is essential, Chest physiotherapy techniques such as expiratory rib cage compression before endotracheal suctioning can be used as a means to facilitate mobilizing and removing airway secretion and improving alveolar ventilation. So that this study was carried out to determine the effect of expiratory rib cage compression before endotracheal suctioning on arterial blood oxygenation (spo2) in patients receiving mechanical ventilation. Material & Method: This study is a randomized clinical trial with crossover design. The study sample included 50 mechanically ventilated patients hospitalized in intensive care wards of hospitals valiasr and ayatollah mousavi in zanja. Subjects were selected based on purposive sampling method. The patients received endotracheal suctioning with and without rib cage compression. With a minimum 3 hours interval between the two interventions. Expiratory rib cage compression was performed for 5 minutes before endotracheal suctioning. Spo2 were measured 5 minutes before and 15, 25 minutes after endotracheal suctioning. Data were recorded on the data recording sheet. Data were analyzed using paired t-tests.

Registration date

mechanically ventilated patients

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria: men patients with stable hemodynamic status within 18-70 years old, with Hct more than 25%, without hyperthermia, chest injury, chest tube, chest surgery and ventilated on PEEP mode, patient with active asthma and emphysema, using endotracheal suctioning 1 hour before intervention. Exclusion criteria: receiving any kind of paralytic muscular drug like Pavlon in intervention time zone, start/stop or change in vasodilator drug in intervention time zone, change in ventilator setup, using endotracheal suctioning 1 hour before each phase of intervention, changing ventilator mode as with CMV mode.

Age

From **18 years** old to **70 years** old

Health conditions studied

1

Description of health condition studied

patients under mechanical ventilation

ICD-10 code

J00-J99

ICD-10 code description

Primary outcomes

1

Description

Arterial blood oxygenation

Timepoint

5 minutes before and 15 and 25 minutes after intervention in each phase

Method of measurement

using vital sign monitoring system with Poyandegan Rahe Saadat made in Iran

Secondary outcomes

1

Description

Vital sign including Blood pressure, pulse, respiratory rate

Timepoint

5 minutes before and 15 and 25 after intervention in each phase

Method of measurement

mm/hg for BP, number for Pulse and respiratory rate announced by vital sign monitoring system Pooyandegan rahe Saadat made by Iran

Intervention groups

1

Description

on every patients two intervention was performed with a 3 hours interval. we divided patients randomly in to two group. on patient in group A in first phase of study endotracheal suctioning was performed without rib cage compression. With a minimum 3 hours interval, this procedure repeated this time with rib cage compression. for group B in the first phase endotracheal suctioning was performed with rib cage compression. With a minimum 3 hours interval between the two interventions this procedure repeated this time without rib cage compression.. vital sign and Spo2 were assessed three times: 5 minutes before endotracheal suctioning, 15 and 25 minutes after endotracheal suctioning. Data were recorded on the data recording sheet.
