A randomized controlled trial of effect of PLISSIT and Sexual Health models on women sexual problems

Protocol summary

fz.farnam@gmail.com

Summary

A single-blind, randomized controlled clinical trial will be conducted between August 2012 and March 2013. The aim of this study is to compare the effect of «PLISSIT model» with «Sexual Health model» in women with sexual problems in Tehran, Iran. Eighty-four women aged 20-45 years with history of sexual problem will be randomly allocated to receive either PLISSIT model intervention or Sexual Health model. The main outcome of the study, sexual function and sexual distress, will be measured respectively, with the Brief Index of Sexual Function for Women (BISF_W) and Female Sexual Distress Scale_ Revised (FSDS_R) questionnaires, at base line, 2.5 and 7 months post -intervention

Intervention groups

1

Description

PLISSIT model (Permission, Limited Information, Specific Suggestions, Intensive Therapy) : The subjects in this group will receive five 60- minute therapy sessions. Sessions 1, 2, 3, 4 and 5 are all adapted from the PLISSIT treatment model including four therapeutic stages. St1: Permission; client freely talks about her sexual concerns. Permission also is given to those non-problematic sexual behaviors which subject has already experienced. St2: Limited Information; therapist provides patient with limited information about the given problem. St3: Specific Suggestions; specific recommendations are offered enabling patient to manage her sexual problems. The fourth stage: Intensive Therapy; psycho-sexual therapy is performed by the researcher or Co-I psychiatrist. All subjects will be provided the five therapy sessions even if they might not need to receive intensive therapy. Researcher will be in contact with the subjects regularly to avoid missing follow up as well as addressing their concerns related to the therapy. Interventions for the subjects will be free of charge.
