Effect of training package on self-care behavior and quality of life in pregnant women with gestational diabetic

Protocol summary

Summary

Objectives: This study aims to determine the effect of training package on self-care behavior and quality of life. **Design:** Two parallel arm Randomized Controlled Trial. **Setting and conduct:** This study will be conducted on 92 pregnant women with gestational diabetes referring to Tohid Hospital in Sanandaj. Eligible women will be selected convenience and will be randomly assigned into two groups with block sizes of 4 and 6 and allocation ratio of 1:1. A person from research team not involved in the recruitment and assigning participants will generate allocation sequence using a computerized program. Opaque sealed sequentially numbered envelopes will be used for allocation concealment. **Participants:** Pregnant women with gestational age of 24-28 weeks that suffering from gestational diabetes. **Interventions:** Individuals in the intervention group will receive education about self-care behaviors regarding diabetes. Education plan includes four educational sessions as group discussion about 60 minutes; held for groups of 7 to 14 persons for four consecutive weeks. At the end of the first session, a booklet will be given to intervention group. The individuals in the control group will receive routine educations of prenatal care. **Main outcome measures** include self-care behavior and quality of life that will be assessed by self-care behavior and quality of life (QOL-GRAV) questionnaires before and four weeks after the end of intervention. **Secondary outcomes** include pregnancy outcomes (gestational age at delivery, delivery type and anthropometric indices of newborn) that will be assessed by checklist after childbirth.
