The effect of group counselling on health promoting lifestyle and quality of life in women who have undergone mastectomy: a randomized controlled clinical trial

Protocol summary

Summary

Objectives: To determine the effect of group counselling on health promoting lifestyle and quality of life in women who have undergone mastectomy. Design: Randomized controlled trial. Conduct: This study will be conducted on 76 women under the age of 60 years old who have undergone mastectomy during the last five years in state and private hospitals of Tabriz. The researcher will refer to hospital and will select eligible women through convenience sampling method and the questionnaires of HPLP-2 will be completed and the women who obtain score lower than 3 will be included in study and written consent will be obtained and also Quality of Life Questionnaire-Cancer 30 will be completed. Participants will be randomly assigned into two groups of counseling and control through block randomization. Participants: 76 women who have undergone mastectomy during the last five years. Intervention: For the intervention group (n= 38), six 60 to 90 minute group counseling once a week will be provided. The control group (n= 38) will receive routine cares. The main outcome variables include health promoting lifestyle and quality of life that will be assessed before intervention, four and eight weeks after the intervention through HPLP-2 and Quality of Life Questionnaire-Cancer 30.
