Assessing the effect of relaxation techniques on fetal outcomes in high risk pregnant women with sleep breathing disorders

Protocol summary

Summary

Among high risk pregnant women 180 cases that their scores from Peterborough Sleep Quality Index questionnaire are 5 or more will be selected. The subjects are randomly divided into 2 groups (intervention and control group). Relaxation techniques will be taught to intervention group. The intervention group will carry out the relaxation techniques for 8 sessions while the control group will be received routine care only. In the end of intervention, both the intervention and the control group will fill Peterborough Sleep Quality Index questionnaire again. Furthermore such variables like newborn weight and apgar score, PH and Interleukin concentration of umbilical blood samples will be measured after delivery.
