Efficacy of intravenous paracetamol versus intravenous morphine and intravenous ketorolac in controlling renal colic in emergency ward patients of Shahid Mohammadi Hospital, Hormozgan University of Medical Sciences

Protocol summary

Summary

Patients with flank pain diagnosed as renal colic confirmed by sonography or spiral CT scan are entered in this study. Patients are divided in 3 groups: case group (receiving intravenous apotel), control group (receiving intravenous morphine) and third group receiving 30 mg intravenous ketorolac. A questionnaire containing demographic data, diagnosis, sonographic or CT scan findings. Inclusion and exclusion criteria are recorded and severity of pain is defined by visual or verbal criteria. The nurse administers the medications randomly and 1st dose is given and after 30 minutes the pain is checked according to verbal or visual pain assessment scale; if pain is not decreased, then a dose of rescue analgesic (fentanyl) is given. The patients are observed for 6 hours in surgical emergency ward.

Scientific title

Efficacy of intravenous paracetamol versus intravenous morphine and intravenous ketorolac in controlling renal colic in emergency ward patients of Shahid Mohammadi Hospital, Hormozgan University of Medical Sciences

Public title

Efficacy of intravenous paracetamol versus intravenous morphine and intravenous ketorolac in controlling renal colic in emergency ward patients of Shahid Mohammadi Hospital, Hormozgan University of Medical Sciences

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criterion: symptoms of renal colic verified by

sonography or spiral CT scan. Exclusion criteria: allergy; suspected ruptured abdominal aortic aneurysm; history of hepatic or renal insufficiency; liver or kidney transplant; history of asthma; dialysis; hemodynamic instability; suspected pregnancy; fever more than 38 celsius orally; peritoneal irritation; use of parenteral analgesic 6 hours PTA.

Age

From **15 years** old to **60 years** old

Gender

Both

Phase

3
