Prophylactic administration of intravenous Paracetamol for control of shivering during and post cesarean section with spinal anesthesia

Protocol summary

Summary

Shivering is a common intra and postoperative problems with a 20%-60% reported incidence. In addition to patient's discomfort, intra and postoperative hypothermia and shivering interfere with patient's monitoring and can increase oxygen consumption and CO₂ production. Recently paracetamol have been used at the end of surgery and have been shown to be effective in the prevention of intra and postoperative shivering. The aim of this study is to evaluate the effect of paracetamol in prevention of shivering in patients undergoing to cesarean section with spinal anesthesia with suggestion that prophylactic administration of this agent can prevent intra and postoperative shivering or reduce its severity. After obtaining written informed consent for entering to study, one hundred pregnant patients scheduled for cesarean section, will be enrolled in two groups of 50 and received spinal anesthesia. Case group will be administered infusion of 1000 mg paracetamol in 100 cc normal saline immediately after delivery and the control group will receive normal saline as placebo in the same volume. The incidence and severity of intra and postoperative shivering will be checked and recorded according to Crossley and Mahjon scores. Shivering scores equal to or higher than 3 will be treated with 0.5 mg/kg IV petidine.

Scientific title

Prophylactic administration of intravenous Paracetamol for control of shivering during and post cesarean section with spinal anesthesia

Public title

Prophylactic administration of intravenous Paracetamol for control of shivering during and post cesarean section with spinal anesthesia

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria: pregnant women aged between 16 to 45 years old candidate for elective cesarean section with spinal anesthesia; ASA physical class I or II with informed consent for spinal anesthesia. Exclusion criteria: patients with ASA physical class III or higher; contraindication for administration of NSAIDs and paracetamol; peptic ulcer; coagulopathy; renal failure; hepatic failure; fever; any contraindication for performing spinal anesthesia

Age

From **16 years** old to **45 years** old

Gender

Female

Phase

2-3

Groups that have been masked

No information

Sample size

Target sample size: **100**

Health conditions studied

1

Description of health condition studied

Intra and post spinal anesthesia shivering

ICD-10 code

R68.0

ICD-10 code description

Hypothermia, not associated with low environmental temperature

2

Description of health condition studied

complications of anaesthesia

ICD-10 code

T88.5

ICD-10 code description

Other complications of anesthesia

Primary outcomes

1

Description

Severity of perioperative and postoperative shivering

Timepoint

In recovery every 15 minutes until discharge from recovery

Method of measurement

Crossly and Mahjon five-point scoring system

2

Description

Incidence of intra and post spinal anesthesia shivering

Timepoint

During of surgery and in the recovery room

Method of measurement

visual

Secondary outcomes

1

Description

Need to drug for treatment of shivering

Timepoint

During surgery and in recovery room

Method of measurement

Dose of drug

Intervention groups

1

Description

Intervention group: in this group paracetamol 1000mg in 100 cc normal saline was infused during 15 -20 min after neonatal delivery for prevention of intra and post-operative shivering .

Category

Treatment - Drugs

2

Description

Control group: in this group normal saline iv in same volume intervention group was infused as placebo at

15-20 min after neonatal delivery .

Category

Placebo
