Effectiveness of Regular Breathing Technique (He-Hu) on Reduction of Intrathecal Injection Pain in Leukemic Children: A Randomized Clinical Trial

Protocol summary

Summary

Children with chronic diseases such as leukemia are subjected to pain during various procedures. Distraction is one of the easiest and least costly methods of non-pharmacological pain relief that has not been paid attention to by nurses. In the present study, the effectiveness of regular breathing method (hey-hu) in reduction of pain of intrathecal injection in leukemic children is evaluated. This study is conducted as a single blind randomized clinical trial among 100 patients coming to Shahid sadoughi Hospital, Yazd, Iran. The patients are 6-15 years old children coming to oncology ward suffering from leukemia. They are selected and randomly allocated to either regular breathing group or control group in equal numbers. The pain of children is assessed by Wong pain face scale.

Scientific title

Effectiveness of Regular Breathing Technique (He-Hu) on Reduction of Intrathecal Injection Pain in Leukemic Children: A Randomized Clinical Trial

Public title

Effectiveness of Regular Breathing Technique (He-Hu) on Reduction of Intrathecal Injection Pain

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria: alertness, verbal, subjective, visual and hearing ability; absence of pain and physiological needs (thirst, need for excretion....) before injection. The patients were 6-15 years old children coming to oncology ward suffering from leukemia. Exclusion criteria: Those patients who had a second injection were excluded from the study. We also excluded patients who had any

respiratory difficulties.

Age

Intervention groups

1

Description

The He-Hu technique was demonstrated to the subjects before injection in the study group which was as follows: The child was asked to initially inhale deeply and utter 'He; while exhaling. Then the child was asked to inhale deeply again and utter 'Hu' while exhaling. This method was practiced with the child in order to implement it accurately and was performed one minute before procedure till the end of the procedure. A respiratory rate of 20-30 per minute was considered for the children.
