Comparison of effectiveness of topical chamomile oil and placebo in the advancement of Boston questionnaire's score and electrodiagnostic criteria of patients with mild and moderate carpal tunnel syndrome

Protocol summary

Summary

This is a randomized, placebo-controlled, triple blinded clinical study to evaluate the effects of topical chamomile oil on the treatment of mild and moderate carpal tunnel syndrome. 80 hands with primary idiopathic CTS aged between 18-70, after taking signed informed consent, according to the electrodiagnosis classification criteria with clinical picture correlated with CTS, are included in this trial. The main exclusion criteria included: recurrent carpal tunnel syndrome; Positive history of trauma or fracture of wrist bones, surgical release of median nerve, direct injection into carpal tunnel of wrist; Evidence of cervical radiculopathy in EMG; Systemic disease including neuropathies (rule out by nerve conduction study of ulnar nerves), collagen vascular diseases such as SLE, scleroderma and RA; Endocrine disease such as hypothyroidism, DM, and other disease-inducing neuropathy; Situations such as renal failure, alcoholism or poor medical condition; History of recent and ongoing use of corticosteroids or analgesics that could not be discontinued. 80 hands with mild and moderate CTS will allocate to two arms by using blocked randomization. Wrist splint is prescribed for both arms. Chamomile oil and paraffin will be given as encoded, innominate bottles with the same shape and color. Both of them are prescribed as 5 drops, morning and night-time doses for 4 weeks. Boston questionnaire score for CTS, at the beginning time and after 4 weeks of trial, will be evaluated, as the primary outcome measure, by a single researcher.

Scientific title

Comparison of effectiveness of topical chamomile oil and placebo in the advancement of Boston questionnaire's score and electrodiagnostic criteria of patients with mild

and moderate carpal tunnel syndrome

Public title

Effect of chamomile oil in the treatment of carpal tunnel syndrome

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: primary idiopathic carpal tunnel syndrome; patients aged between 18-70 years old; electrodiagnostic criteria for mild or moderate CTS; Patient's written informed consent for inclusion; having at least two signs or one sign plus one symptom of: paresthesias, numbness, tingling, night pain positive Phalen test, positive Tinel test, positive compression test. Exclusion criteria: Clinical and electrodiagnostic evidence of severe CTS including muscular atrophy and neurogenic changes in needle EMG of APB muscle; recurrent carpal tunnel syndrome; Positive history of trauma and/or fracture of wrist bones and/or surgical release of median nerve and/or direct injection into carpal tunnel of wrist; Evidence of cervical radiculopathy in EMG; Systemic disease including: neuropathies (rule out by nerve conduction study of ulnar nerves) and/or collagen vascular diseases such as SLE and scleroderma and RA; Endocrine diseases such as hypothyroidism and DM; Other disease-inducing neuropathy; Situations such as renal failure and/or alcoholism and/or poor medical condition; History of recent and ongoing use of corticosteroids or analgesics that could not be discontinued; hypersensitivity to the drug or placebo; inability to completion of data gathering forms (cognitive or language disorder).
