Comparison Between the Effect of Nd: YAG Laser and Glucantime on Treatment of Cutaneous Leishmaniasis

Protocol summary

Summary

This study, which is performed as clinical experimentation, is regarding Leishmaniasis. The samples were selected from among the leishmaniasis patients who visited the 17 Shahrivar Hygiene and Treatment Center in Ahwaz. In the first session, two separate leishmanial injuries are specified on the patient's body. The two injuries are subjected to clinical examination. The rate of induration was determined and a score of 1 to 5 was assigned by the examiner (a dermatology assistant). Then each injury was treated using one of the following two methods: A: To one of the injuries, Meglumine antimony is injected using a 1 cc insulin syringe. The maximum injection amount in each session is 1-2 cc. The injection is repeated weekly until the complete improvement of the injury, with a maximum of 10 injections. B: The other injury is subjected to laser treatments (AlexandritLtroni, Nd-YAG, and flow index of 220 J). Treatment with Nd-YAG is repeated in 2-week intervals until complete improvement (no indurations). (Maximum 5 treatment sessions.) In every treatment session, each injury is photographed and the rate of in duration is assigned a score of 1 to 5 by the examiner. After 10 weeks from the start of the treatment, the treatments are stopped and the above information is registered again. Follow-up of the skin injuries is performed after improvement and 3 months later. In each follow-up session, the injury is examined with regards to the scar and PIH, and photographed.

Health conditions studied

1

Description of health condition studied

Cutaneous leishmaniasis

ICD-10 code

B55.1

ICD-10 code description

Cutaneous leishmaniasis

Primary outcomes

1

Description

Complete improvement of the injury

Timepoint

At the end of every session, 10 weeks after start of treatment, and 3 months after improvement

Method of measurement

Measuring the induration and the size of the injury

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group 2: The other injury is subjected to laser treatments (AlexandritLtroni, Nd-YAG, and flow index of 220 J).

Category

Treatment - Other

2

Description

Intervention group 2: To one of the injuries, Meglumine antimony is injected using a 1 cc insulin syringe. The maximum injection amount in each session is 1-2 cc. The injection is repeated weekly until the complete improvement of the injury, with a maximum of 10 injections.
