Comparison of the effects of supportive care for the mother and acupressure at BL32 point on the severity pain and outcome of labor in pregnant women

Protocol summary

Summary

This study is a randomized clinical trial on 150 women who had referred to Shoushtari hospital, Shiraz, Iran and compare the effect of supportive care for the mother and acupressure (the BL32) on the severity pain and outcome of labor in pregnant women is discussed. After obtaining informed consent, eligible women were allocated randomly into three groups (two experimental groups and one control group). In all three groups, the standard scale for measuring pain intensity, pain assessment (VAS) was used. The first group, the intervention was that the researcher was beside the mother since her entrance into the department, calmed and encourages the mother to be in positions to suit different stages of labor with cervical dilatation were performed. In the second group, in 3-4 and 7-8cm dilatation, the mother was placed in a proper position and BL32 point was pressed. The pressure was continuously and gently applied by both thumbs for 20 minutes. It was applied by the beginning and stopped at the end of the contractions. On the other hand, the control group only received the department's routine care and underwent no interventions and was indirectly monitored. In all groups, pain intensity before and after the intervention, the progress of labor and delivery process was studied.

Scientific title

Comparison of the effects of supportive care for the mother and acupressure at BL32 point on the severity pain and outcome of labor in pregnant women

Public title

The impact of supportive care for the mother and acupressure at BL32 point on the severity pain and

outcome of labor in pregnant women

Purpose

Supportive

Inclusion/Exclusion criteria

The inclusion criteria of the study were gestational age of 37-41 weeks based on the date of the last menstrual cycle or first and second trimester ultrasound; first or second pregnancy; mother's age between 18 and 35 years old; single pregnancy; head presentation; lack of obvious chromosomal abnormalities and fetal anomalies; not using any special drugs during pregnancy, and having at least middle school degree. Exclusion criteria of the study were maternal diabetes; growth restriction; Rh incompatibility; history of smoking; history of tobacco use; preeclampsia; oligohydramnios; placenta previa; placental abruption; thick meconium; suffering from any physical or mental disorder, and receiving any kind of medication including pethidine; hyoscine; oxytocin, and atropine.
