A Clinical Trial of Comparison between Sodium Bicarbonate and Sodium Chloride Effects for Prevention of Contrast-Induced Acute Kidney Injury Following Diagnostic Coronary Angiography

Protocol summary

Summary

Objectives: The purpose of this study is to compare the incidence of contrast-induced acute kidney injury (CI-AKI) following coronary angiography after administration of sodium bicarbonate and sodium chloride. **Design:** This investigation is randomized and single-blinded. **Setting and conduct:** All patients undergoing coronary angiography are assessed and those who fulfill inclusion criteria are enrolled. One-hundred fifty eight patients are entered into two groups including seventy nine patients. A written informed consent is obtained from all of the patients. And then, all of them will be followed concerning incidence of CI-AKI at 48 hours after coronary angiography. **Participants including major eligibility criteria:** The major inclusion criteria include creatinin level greater than 1.5 mg/dl in men and greater than 1.4 mg/dl in women; creatinin clearance less than 60 ml/min/1.73 m²; older than 18 years; and history of diabetes mellitus for more than one year. The exclusion criteria include cardiogenic shock; heart failure; acute coronary syndrome recently undergone angiography or angioplasty; recent dialysis; single kidney; and any infusion of contrast media such as radiologic interventions. **Intervention:** Group 1 receives sodium chloride 0.9% as 1 mg/kg/h through 12 hours before and after coronary angiography. Group 2 undergoes infusion of sodium bicarbonate (154 mEq in serum DW5%) as 3 mg/kg/h during 1 hour prior to coronary angiography and as 1 mg/kg/h during 6 hours after coronary angiography. **Main outcome measures:** The patients with rising in their creatinin level either up to 0.5 mg/dl or 25% more than basic amount are considered as CI-AKI

Primary outcomes

1

Description

Creatinine

Timepoint

prior angiography and at 48 hours after angiography

Method of measurement

Serum level, mg/dl

Secondary outcomes

1

Description

Creatinin change

Timepoint

Prior angiography and 48 hours after angiography

Method of measurement

serum level, mg/dl

Intervention groups

1

Description

Treatment group: sodium bicarbonate (154 mEq/l in serum DW5%) as 3 mg/kg/h during 1-hour prior to coronary angiography and as 1 mg/kg/h during 6-hour following coronary angiography

Category

Prevention

2

Description

Control group: sodium chloride 0.9% as 1 mg/kg/h through 12 hours before and after coronary angiography

Category

Prevention
