### Evaluation of effect of consumption kafir probiotic on saliva count of candida albicans in chemotherapy patients

#### Protocol summary

##### Summary

The aim of this study is evaluation the effect of probiotic consumption on count of albicans candida in chemotherapy patients. In this study, single-blind clinical trial, 50 patients as inclusion criteria (Breast Cancer Patients with Cancer of the colon or candidates for chemotherapy, etc.) and exclusion (pregnant women, smokers, etc.) are selected. Patients are randomly divided into two groups. The intervention group Kafir probiotic yogurt drink and the control group are consumed mineral water. Subjects in both groups at certain hours of the day, hundred cc of it are used. In this study, blood and saliva samples are taken five times. At the turn of chemotherapy, blood and saliva samples will be carried out before receiving chemotherapy drugs. Likewise other samples are taken before the next chemotherapy sessions. The last samples from patients are taken at the end of probiotic administration. At the end of consumption albicans Candida are compared in the two groups. The primary outcome of this study, is saliva count of candida albicans.
