Effect of parenteral human albumin on visceral proteins in critical patients

Protocol summary

Summary

The high prevalence of malnutrition and related problems in intensive care unit patients and controversial results in administration of intravenous albumin in these patients. This study is designed to determine the effect of intravenous albumin on the level of human visceral proteins in hospitalized patients in intensive care units, and the results of this study determined the efficiency of intravenous albumin to reduce malnutrition. This study is a randomized double-blind placebo-trials is done in the intensive care units. Inclusion criteria are adult patients with serum albumin less than 3.5 g/dl who endure the volume of gastric antral support at least 200 cc /3hr and have a minimum of 24 hours of ICU stay. Exclusion criteria are patients with enteral feeding intolerance up to 48 hours, patients with kidney and liver disease and any underlying medical condition that is associated with protein loss are excluded. After the final selection, participants were randomly divided into two groups; 1) intravenous human albumin supplement of 20 mg per day with a normal diet and 2) high protein diet + placebo. The period of the study is at least 6 days, and biochemical variables like serum albumin, pre-albumin, CRP levels were measured weekly throughout the project from beginning to end.

Scientific title

Effect of parenteral human albumin on visceral proteins in critical patients

Public title

Effect of parenteral albumin on nutrition status in critical patients

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria: adult patients; serum albumin less than 5/3 g per deciliter; have the power and volume of gastric antral support at least 200 cc every 3 hours; a minimum of 24 hours of ICU stay and not take part in another trial research. Exclusion criteria: patients with feeding intolerance antral; antral power outages up to 48 hours;

patients with kidney disease; liver disease and any underlying medical condition that is associated with protein loss are excluded. Patients who change the way they eat or be transferred to other centers throughout the city are also excluded.
