Comparison of the effects of one-stage full-mouth disinfection and quadrant-wise scaling and root planing on serum levels of IL-27 and clinical parameters following treatment of moderate-to-severe chronic periodontitis

Protocol summary

Summary

The aim of the present study was to compare the inflammatory processes in the two one-stage full-mouth disinfection technique and the quadrant-wise scaling and root planning procedure to determine IL-27 serum level. The subjects who have chronic to severe periodontitis and without history of systemic condition which delay would healing and without using of immune-suppressive drugs are selected to study. In the test group scaling and root planning with disinfection of oral cavity was done. The quadrant-wise patients underwent scaling and root planing procedures at two-week intervals for each quadrant (6 weeks). Blood samples were taken in 3 times (before, 2 month and 4 month after scaling and root planing).

Scientific title

Comparison of the effects of one-stage full-mouth disinfection and quadrant-wise scaling and root planing on serum levels of IL-27 and clinical parameters following treatment of moderate-to-severe chronic periodontitis

Public title

Comparison of One-Stage Full-Mouth Disinfection and Quadrant-Wise Scaling and Root Planing

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: The subjects had at least 12 teeth (irrespective of third molars and teeth with orthodontic appliances, bridgeworks, crowns and implants) with the 30% of the teeth with clinical attachment loss of ≥ 3 mm; radiographic evidence of bone loss in each group.

Exclusion criteria: included systemic conditions: conditions which delay would healin: a history of radiotherapy or immune-suppressive treatment modalities: pregnancy or breast-feeding: use of systemic antibiotics during the two previous months: a history of continuous consumption of NSATDs : a history of scaling and root planing during the previous year

ko5.3

ICD-10 code description

chronic periodontitis

Primary outcomes

1

Description

serum levels of IL_27

Timepoint

befor intervation,2 month and 4 month after intervation

Method of measurement

special laboratory kit

Secondary outcomes

1

Description

bleeding on probing

Timepoint

befor intervation,2 month and 4 month after intervation

Method of measurement

probing

2

Description

clinical attachment level

Timepoint

befor intervation,2 month and 4 month after intervation

Method of measurement

distance between floor of pocket to CEJ

3

Description

probing depth

Timepoint

befor intervation,2 month and 4 month after intervation

Method of measurement

distance between floor of the pocket to free gingiva

Intervention groups

1

Description

After blood samples were taken in the test group , the entire oral cavity was cleaned by an ultrasonic scaler in two sessions in less than 24 hours in order to decrease pathogenic organisms' counts. Subgingival irrigation of all the pockets was carried out with 0.2% chlorhexidine using an insulin syringe in order to remove all remaining bacteria. An antiseptic agent (0.2% chlorhexidine) was used to brush the dorsum of the tongue to decrease the bacterial load in the area; an antiseptic mouthwash (0.2% chlorhexidine) was used to reduce bacterial load in the saliva and on the tonsils.

Category

Treatment - Other

2

Description

The control group patients underwent scaling and root planing procedures at two-week intervals for each quadrant after blood samples were taken.
