Study of the effects of local platelet-rich plasma (PRP) injection versus autologous blood injection in patients with lateral epicondylitis in PM & R clinic of Modarres hospital from 2011 to 2013

Protocol summary

Summary

This study was designed to compare the effects of PRP and autologous blood injection in patients with chronic lateral epicondylitis. 45 patients with chronic lateral epicondylitis and intractable pain were divided equally into 2 groups, group A and group B. Group A was treated with a single injection of 2 ml of PRP and group B with 2 ml autologous blood. Both groups used tennis elbow band and did stretching and strengthening exercises during 2 months of follow up. Pain visual analog scale (VAS), Mayo score (Modified Mayo clinic performance index for the elbow) and Pressure pain threshold (PPT) were evaluated at the beginning, 4 and 8 weeks after treatments.

Scientific title

Study of the effects of local platelet-rich plasma (PRP) injection versus autologous blood injection in patients with lateral epicondylitis in PM & R clinic of Modarres hospital from 2011 to 2013

Public title

Study of the effects of local platelet-rich plasma (PRP) injection versus autologous blood injection in patients with lateral epicondylitis

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: history of chronic (at least 3 months) pain or swelling of the lateral epicondyle and pain more than 5 of 10 according to visual analogue scale.

Exclusion criteria: systemic disorders such as diabetes, rheumatoid arthritis, hematological diseases (coagulopathy), severe cardiovascular diseases, infections, immunosuppression, patients in therapy with

anticoagulants or antiaggregants, the use of NSAIDs in the 2 days before blood donation and patients with Hb values of 10 and platelet values of 100,000/mmc; Pregnancy; vasovagal shock; injection of corticosteroid in since 2 weeks ago;any injection in site of tenderness since 1 month ago;malignancy;history of CTS,cervical radiculopathy or radial neuropathy.
