“Effect of educational- supportive intervention for fathers of premature newborn on mother-newborn attachment and parents anxiety”

Protocol summary

Summary

Premature birth is a stressful process for families and supportive program can be a viable solution. The purpose of this study was the impact of the fathers of premature newborns participation in intervention-training program on mother-infant attachment and parental anxiety. This study is a randomized clinical trial that fathers of 60 premature infants hospitalized in neonatal intensive care unit Selected with a 1: 1 allocation will be divided into two intervention and control groups. control group fathers will received ward routine care but in intervention group, Two 45-minute training session using the display content and images with PowerPoint will implemented .The intervention group also will received a package contains a CD and a colored manual prepared by the researcher. At the end of the first session, they will visit he neonatal intensive care unit and other part of education will done at the baby's bedside. One day after the intervention, the parents have 3 days non-designated visiting hours for meeting personal needs and baby's care. The mother-infant attachment with Avant checklist and parents anxiety with SpielBerger questionnaire will be measured in both groups in the beginning and end of study.
