Effect of essential oil of Lavender inhalation on open-heart surgery pain

Protocol summary

Summary

The goal of this study is evaluating the effects of inhalation of Lavender essential oil on the pain of open-heart surgery. The main complaint of patients after open-heart surgery is chest pain. Due to the side effects of opioids, it is important to use a non-invasive way to effectively relieve pain including aromatherapy with analgesics. This study is a clinical single-blind trial. The study was conducted on 40 patients who had open-heart surgery in the Cardiac ICU of two Hospitals of Tehran University of Medical Sciences, 2012. The level of patient's pain before and after aromatherapy were analyzed by paired t-tests and chi-square and Fishers' exact is used to investigate the relationship between demographic characteristics and pain. Statistical significance was accepted for $P < 0.05$. Criteria included: full Consciousness, spontaneous breathing ability and not using synthetic opioids within 2 hours before extubation. Also, some exclusion criteria were set in this research. The patients that needed medical intervention during the inhalation, or in case of allergies, respiratory problems and emergencies, were excluded from this research. After extubation, the patients were asked to mark the intensity of their pain using the visual analogue scale. Then, a cotton swab which was impregnated with 2 drops of Lavender essential oil 2% was placed in their oxygen mask, and they got breath for 10 minutes. Thirty minutes after aromatherapy, they were asked to re-mark their pain intensity. The level of patient's pain before and after aromatherapy were compared.
