Comparison of the effects of different doses of Atorvastatin on Plasma homocysteine levels in male Patients with Coronary Atherosclerosis

Protocol summary

Summary

In this study we investigated the effect of different doses of atorvastatin on plasma concentration of homocysteine in male patients with coronary heart disease. In a double-blind clinical trial conducted from April to September 2007, we enrolled 52 male patients who were hospitalized in Mazandaran heart center due to acute coronary syndrome. Patients with unstable angina, sensitivity to statins, diseases of hepatobiliary system, serum creatinine concentrations $\geq 175 \mu\text{mol/l}$ (2.0 mg/dl), left anterior descending artery involvement, history of using QT interval prolongation and P450 suppressant drugs and the patients with unreasonable high creatine kinase were excluded. Patients who met including criteria were divided into three groups randomly and they received 20, 40, and 80 mg atorvastatin daily for six months. Laboratory assessments for measuring the level of Homocysteine were done before and 1, 3 and 6 months after the treatment.

Scientific title

Comparison of the effects of different doses of Atorvastatin on Plasma homocysteine levels in male Patients with Coronary Atherosclerosis

Public title

Comparison of the effects of different doses of Atorvastatin on blood homocysteine levels in male Patients with heart disease.

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Male; Stable; Acute Coronary Syndrome; Documented atherosclerotic lesions in Angiography ; Refused to do Coronary Artery Bypass Graft or Angioplasty Exclusion criteria: Female; Unstable Angina; Sensitivity to Statins ; Diseases of hepatobiliary system ; Serum creatinine concentrations $\geq 175 \mu\text{mol/l}$ (2.0 mg/dl) ; Left anterior descending artery involvement

; History of using QT interval prolongation and P450 suppressant drugs ; unreasonable high creatine kinase

Age

No age limit
