Effects of relaxation training on breastfeeding self-efficacy and quality of sleep in mothers with premature infants

Protocol summary

Summary

This research will be random clinical trial in two groups on 60 mothers having premature neonate (gestational age between 32-36 week) bed ridden in the NICU Mashhad University of Medical Sciences Research and Training centers. Sampling will be done based inclusion criteria. Sampling will be based on inclusion criteria using two-month time block method. The control group receives the ward's regular treatment. The experimental group includes mothers with premature infants admitted in NICU that are selected during the first 24-72 hours after delivery and undergo relaxation training. Progressive muscular relaxation training for mothers is done by the researcher using Jacobson's method in the form of sixteen fold contractions and stretching of body, practically and individually, for thirty to forty five minutes. Mothers are required to do the method at least once a day. Self-efficacy variable of breastfeeding and quality of sleep is measured with breastfeeding self-efficacy questionnaire (Denis 2003) and Petersburg's Sleep Quality Index (PSQI). The questionnaire is initially evaluated during the first 24-72 hours of delivery and then four weeks after delivery and eventually during the eighth week after delivery. Mother inclusion criteria: The mother should be willing to take part in the research, Should be over 18 and under 35 years old, drug abuse is not. Mother exclusion criteria: When the mother hasn't done the relaxation exercise more than three times in a row.

Scientific title

Effects of relaxation training on breastfeeding self-efficacy and quality of sleep in mothers with premature infants

Public title

Effects of relaxation training on breastfeeding self-efficacy and quality of sleep in mothers with premature

infants

Purpose

Supportive

Inclusion/Exclusion criteria

Mother inclusion criteria: the mother should be willing to take part in the research; should be over 18 and under 35 years old; should have finished at least fifth grade of elementary school; shouldn't have skeletal and muscular problems; should have poor quality sleep (Petersburg's Sleep Quality Index score being 5 or above); should be physically fit; should not have temperamental and emotional disorders that hinder effective communication; should have access to audiovisual equipments at home; there may be a phone call; drug abuse is not. Neonate inclusion criteria: age between 32 - 36 weeks; no IUGR; the infant shouldn't be congenitally abnormal; enteral feeding for the infant should have been started in the form of po or pg. Neonate exclusion criteria: the infant should be put on a ventilator; the infant's digestive system should undergo surgery; after feeding has been started, the infant should undergo NPO for more than two days; neonate dies.

Health conditions studied

1

Description of health condition studied

Breastfeeding self-efficacy and quality of sleep

ICD-10 code

O94-O99

ICD-10 code description

Other obstetric conditions, not elsewhere classified

Primary outcomes

1

Description

Breast feeding self-efficacy

Timepoint

Two months after the start of the intervention

Method of measurement

Dennis questionnaire

Secondary outcomes

1

Description

Quality of sleep

Timepoint

Two months after the start of the intervention

Method of measurement

Pittsburgh sleep quality index (PSQI)
