The effects of constant jogging on elderly women's quality of life

Protocol summary

Summary

The elderly comprise a large portion of any society and since the age affects an individual's quality of life greatly, interventions have to be done in their lives in order to improve their quality of life. Constant jogging is one of the proper measures that can be taken to reach the goal. Thus, the present study aims to investigate the effects of constant jogging on elderly women's quality of life. Present study is a clinical trials study and The target population of the study included the women of 65 to 75 years old in Maragheh of which 66 were selected through random sampling from the lists available in the official health care centers. These subjects were mentally and physically healthy and were randomly put into two experimental and control groups. Later on, a six-week Structured and supervised training intervention was given to the experimental group. All subjects answered the quality of life questionnaires before and after the intervention and according to the answers their quality of life was assessed.

Primary outcomes**1****Description**

Quality of life of the elderly

Timepoint

Before intervention, Right after the intervention

Method of measurement

LIPAD quality of life questionnaire

Secondary outcomes

empty

Intervention groups**1****Description**

The intervention group: sport intervention in the experimental group took 6 weeks with 3 sessions of 30 minutes per week. The structured and supervised training protocol consisted of 3 warm-up, aerobic exercise and cool-down stages. The exercises were conducted in groups of 4. The first seven minutes were stretching exercises for warm-up. This section aimed mainly to use some dynamic activities for activation of large muscle groups. In the next stage, the subjects jogged on a treadmill with a digital screen for heartbeat and calorie use for 15 minutes. It should be noted that maximum heartbeat was identified in order to control the severity of the physical activity. In order to do so, in the first 2 weeks the exercises' severity was 55%, in the second 2 weeks, it was 65% and in the final 2 weeks, it reached 75% heartbeat. In the third stage, the subjects were cooled down with stretching exercises similar to the first stage for 7 minutes.
