

Clinical Trial Protocol

Iranian Registry of Clinical Trials

26 Jul 2026

Comparison of conjunctival autografts and amniotic membrane grafts for treatment of pterygium.

Protocol summary

Summary

Aim: The purpose of the study is to determine whether amniotic membrane can be used as an alternative to conjunctival autograft after pterygium excision. Design: Randomized clinical trial. Methods: seventy eyes with either primary or recurrent pterygium are included in this study. All eyes are randomized to undergo conjunctival autograft or amniotic membrane transplantation after pterygium excision by a single surgeon. Twenty seven eyes with primary and 8 eyes with recurrent pterygium will be treated with conjunctival autograft, and 26 eyes with primary and 9 eyes with recurrent pterygium will be treated with amniotic membrane transplantation. Patients are followed up at one week, one month and three months after operation. The main outcome measurement is recurrence rate after surgery. The patients with inadequate follow up are excluded from the study.
