Effect of oral olive oil on healing of 10% to 20 %Total Body Surface Area, deep second degree and more burn wounds in hospitalized patients

Protocol summary

Summary

The purpose of this study was to evaluate the effect of consumption of oral olive oil on clinical outcomes and wound healing of thermally injured patients with hospital stays. One hundred patients with 10% to 20% Total Body Surface Area, deep second-degree and more burn wounds were randomized to receive either oral olive oil or sunflower oil as the oil in their diet. Inclusion criteria were being on oral diet and aged between 13 to 59 years. Patients had to be enrolled within 12 hours of developing these criteria. Patients were evaluated daily for occurrence of wound infection, sepsis and healing of the grafted skin. Also the duration of hospitalization and admission to the intensive care unit were compared in two groups.
