Comparison of prophylactic antiemetic effect of Granisetron, Dexamethasone and Metoclopramide in surgical procedures under general anesthesia

Protocol summary

Summary

In this study 183 men who were candidate for orthopedic surgeries, in the range of 16 to 65 years old, were evaluated. These patients are in ASA I and II classes. According to their visit order, they randomly pick a number from 1 to 183, which are in a basket. In order to the numbers they were divided into three equal groups (n=61). The first group took 3 mg Granisetron, the second one took 8 mg Dexamethasone and the third one took 10 mg Metoclopramide intravenous before anesthesia. During 8 hours after operation, nausea and vomiting were evaluated. Both patients and data analysts were unaware of the preoperative medication of each patient in this study. In all patients, the induction of anesthesia was performed with 2.5 mg/kg propofol, 0.6 mg/kg atracurium, 100 mcg fentanyl and 2 mg midazolam. After intubation, anesthesia maintenance was performed with 1.2 MAC isoflurane and O2 (7 lit/min). All patients received 0.1 mg/kg morphine as a long acting analgesic drug. N2O was not used for the patients.

Scientific title

Comparison of prophylactic antiemetic effect of Granisetron, Dexamethasone and Metoclopramide in surgical procedures under general anesthesia

Public title

Comparison of prophylactic antiemetic effect of three medicines in surgical procedures

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria: men who were candidate for orthopedic surgeries, in the range of 16 to 65 years -old,

were evaluated. The patients who are in ASA I, II classes. Patients who use antiemetic drugs 48 hours before operation and who had post operative nausea and vomiting record in previous surgeries, patients with motion sickness, migraine, diabetes mellitus and smokers were not included. Exclusion criteria: patients who were discharged immediately after recovery.

Age

From **16 years** old to **65 years** old
