Comparison of the effects of intravenous Paracetamol and Indomethacin suppository for pain relief after septorhinoplasty

Protocol summary

Summary

We designed this prospective, double-blind randomized study to compare the analgesic efficacy of a single- dose of rectal Indomethacin with a single- dose of IV Paracetamol, and those who only receive local infiltration of Lidocaine +Epinephrine in patients undergoing septorhinoplasty. Methods: 75 patients with ASA class I and II undergoing open septorhinoplasty are randomized to 3 groups: group 1 receives 1 gr paracetamol IV in 100 ml normal saline, group 2 rectal indomethacin 100 mg, and group 3 normal saline 100 ml infusion 20 minutes before the end of surgery. A standard anesthetic method is used and all patients receive local infiltration of lidocaine + epinephrine in the operating sites. Postoperative pain is assessed by a visual analogue scale score at 15 and 30 min and at 1, 2, 3, 4, 5, 6, 7, and 8 hours after surgery. IV Morphine boluses is used for supplementary analgesia. Sedation scores and the need for supplementary analgesia and adverse events during the first 8 h after surgery are also recorded.

Scientific title

Comparison of the effects of intravenous Paracetamol and Indomethacin suppository for pain relief after septorhinoplasty

Public title

The effects of intravenous Paracetamol and Indomethacin suppository for treating pain after septorhinoplasty surgery

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: ASA class 1-2, 18-50 years- old patients

Exclusion criteria: drug or alcohol abuse; allergy to study drugs or their constituents; history of renal or hepatic failure or disease; asthma; peptic ulcer; a history of seizures; history of chronic pain.

Age

From **75 years** old to **43 years** old

Gender

Both

Phase

Health conditions studied**1****Description of health condition studied**

Pain after septorhinoplasty surgery

ICD-10 code

Y83.8

ICD-10 code description

Surgical and other medical procedures as the cause of abnormal reaction of the patient, or of later complication, without mention of misadventure at the time of the procedure

Primary outcomes**1****Description**

Postoperative pain scores

Timepoint

15 and 30 min and at 1, 2, 3, 4, 5, 6 ,7, and 8 hours after surgery.

Method of measurement

A 0 to 10 visual analogue scale (VAS) score

Secondary outcomes**1****Description**

Supplementary analgesia

Timepoint

During 8 hours study period

Method of measurement

if pain scores are 4 or greater or on patient's demands.

2**Description**

Sedation scores

Timepoint

15 and 30 min , and 1, 2, 3, 4,5,6,7, and 8 hours after surgery.

Method of measurement

Ramsay Sedation Score

3**Description**

Adverse effects

Timepoint

Continuously during 8 hours study period.

Method of measurement

Observation

Intervention groups**1****Description**

Group 1 receives a single dose of 1 gr Paracetamol IV in 100 ml normal saline, 20 minutes before the end of surgery.

Category

Treatment - Drugs

2**Description**

Group 2 receives a single dose of rectal Indomethacin 100 mg, 20 minutes before the end of surgery.

Category

Treatment - Drugs

3**Description**

Group 3 receives Normal saline 100 ml infusion, 20 minutes before the end of surgery.
