

Clinical Trial Protocol

Iranian Registry of Clinical Trials

18 Jul 2026

Evaluation of adding smoking cessation programs to drug abuse treatment in Tehran centers 2010

Protocol summary

Summary

Drug abuse treatment is a major health and social problem in Iran with 5 to 10% successful abstinence in reports. As all of drug users are smoker, quitting smoking may increase the rate of success according to international studies. For the first time in Iran this clinical trial is carried out in all clients admitted the drug rehabilitation centres. Subjects were randomly allocated into the intervention and control groups. The intervention group received 12 weeks of nicotine replacement and behaviour therapy. Both groups were followed for about a year. Nicotine replacement therapy was delivered in the form of nicotine patches in addition to methadone therapy in case group. 200 patients were recruited in each group after consenting to attend the study. Quitting smoking is the outcome measure that will be documented by CO expiratory test during follow-up
