Mind -fullness therapy (based on cognitive therapy) on irrational beliefs and social appraisal of cancer patients with appearance change: Effectiveness study

Protocol summary

Summary

Objectives: Objectives: This study aims at the effects of mind -fullness therapy (based on cognitive therapy) on cancer patients with appearance change (such as changing in face, cutting body, sever alopecia) and studying the efficacy of this treatment on the irrational beliefs and social appraisal and comparing the results to those of control group. **Design:** This study is a semi-experimental research based on pre-test and post-test with a control group. Research population consists of all cancer patients with appearance change. From the above-mentioned population, 40 subjects have been selected through available non-random sampling. **Execution:** Subjects are divided into two experimental and control groups in a random manner. Then, subjects in the experimental group are being trained for “mind -fullness therapy” in 8 sessions. Subjects in control group will not receive any training. **Criteria for Entrance to and Exit from the Study:** Diagnosis of breast cancer in the subjects, visible physical appearance change during cancer treatment (such as changing in face, cutting body, sever alopecia) and their high education are of criteria for entering into the study. accompanied diseases (such as diabetes), Lack of knowledge regarding the disease and lack of inclination of patients for attending at intervention sessions are of criteria for exiting from the study. **Interventions:** Subjects in both experimental and control groups will be initially tested using measuring tools for irrational beliefs and social appraisal. Then, subjects in the experimental group are being trained for “mind -fullness therapy” and will be post-tested for the extent of change in irrational beliefs and social appraisal (elementary consequent variable) and compared to those in control group
