The effect of not opening the external oblique fascia on surgical complications in comparison with surgical method with opening the external oblique fascia in pediatric inguinal hernia surgery

Protocol summary

Summary

The purpose of this study was the investigation into the effect of not opening the external oblique fascia on surgical complications in comparison with surgical method with opening the external oblique fascia in pediatric inguinal hernia surgery. A group of 50 children with inguinal hernia will be considered and randomly divided in two groups each with 25 people and one of the groups will undergo surgery with opening external oblique fascia and other group without opening the external oblique fascia. All the patients will have a short follow-up during surgery and after surgery and the first day after surgery and the first week after surgery for early complication and also a long-term follow-up during the first and six months after surgery for long-term complications. The results will be analyzed by statistical methods. The inclusion criteria: age under 4 years, presence at specified times to be followed-up, and no hernia complication before surgery. Exclusion criteria: age over 4 years, hernia complication before surgery, absence at specified times to be followed-up. The main outcome variable is fewer complications after surgery.

Scientific title

The effect of not opening the external oblique fascia on surgical complications in comparison with surgical method with opening the external oblique fascia in pediatric inguinal hernia surgery

Public title

The effect of surgical methods on pediatric groin hernia surgery complications

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: age under 4 years, be present at specified times to track, not complicated before hernia surgery
Exclusion criteria: age over 4 years, before surgery the hernia were complicated, were not present at specified times to track

Age

To 4 years old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: 50

Randomization (investigator's opinion)

Randomized

Randomization description**Blinding (investigator's opinion)**

Health conditions studied**1****Description of health condition studied**

inguinal hernia in infant

ICD-10 code

K40,K40.0,

ICD-10 code description

Inguinal hernia, Bilateral inguinal hernia, with obstruction, without gangrene, Bilateral inguinal hernia, with gangrene, Bilateral inguinal hernia, without obstruction or gangrene, Unilateral or unspecified inguinal hernia, with obstruction, without gang

Primary outcomes**1****Description**

Complications of surgery

Timepoint

During the surgery, immediately after surgery, one day after the surgery, a week after surgery, one month after surgery, six months after surgery

Method of measurement

Physical examination and observation by physician

Secondary outcomes**1****Description**

Surgical incision size

Timepoint

During surgery

Method of measurement

Ruler

2**Description**

Surgical duration

Timepoint

From the beginning to the end of the surgery

Method of measurement

Stopwatch

3**Description**

Relapse after surgery

Timepoint

A week after surgery, one month after surgery, six months after surgery

Method of measurement

Physical examination and observation by physician

Intervention groups**1****Description**

Intervention1 (intervention group) : surgery without opening the external oblique fascia, in this surgical procedure the tissues are damaged less since the external oblique fascia is not be entered

Category

Treatment - Surgery

2

Description

Intervention2 (control group) : Surgery with opening the external oblique fascia

Category

Treatment - Surgery
