Evaluation of the effect of topical thermotherapy (with thermomed) in the treatment of anthroponotic Leishmaniasis in a pilot study

Protocol summary

Summary

Objective: The aim of this phase 3, clinical study is to evaluate the effect of topical thermotherapy (with thermomed) in the treatment of anthroponotic Leishmaniasis. Design: In leishmaniasis clinic of Imam Reza hospital, twenty cases of Cutaneous Leishmaniasis will be selected accidentally. Inclusion criteria are: confirmed diagnosis of cutaneous Leishmaniasis by PCR lesions, less than six months of duration, informed consent for participation. Exclusion Criteria are: pregnancy, more than 5 lesions, Very extensive lesions (more than ten centimeters). Setting: The lesion will be treated with thermotherapy (50 degree of Centigrade for 30 seconds) one session and after one month, patients will be visited and the lesion changes and probable side effects would be recorded. For cases in which the considerable induration in lesions remains, treatment will be carried out once again. After 6 months of treatment, patients will be visited again and evaluated and the course of disease and possible complications would be recorded. main outcome measures: Finally, the patients will be divided into three categories in terms of lesion consistency and size (the size of induration). Early improvement: more than 50% of reduced induration during three months after treatment. Definite improvement: including early improvement and not return of lesion during in the six-month follow-up. Failure of treatment: increased the lesion size or improvement of less than 50% of lesions in 3 months follow up or return of the lesion in six months follow-up.

Scientific title

Evaluation of the effect of topical thermotherapy (with thermomed) in the treatment of anthroponotic Leishmaniasis in a pilot study

Public title

Evaluation of the effect of topical thermotherapy (with thermomed) in the treatment of anthroponotic

Leishmaniasis in a pilot study

Purpose
Treatment

Inclusion/Exclusion criteria
inclusion criteria: clinical features of lesion consistent with Anthroponotic leishmaniasis; specified L. tropica with Molecular method PCR; the patient has indication for local therapy based on clinical judgment; up to 6 months of the lesion duration; the patient already not had any treatment for cutaneous Leishmaniasis; consent for participate in this study. Exclusion Criteria: incompetence for regular follow-up; presence of secondary infection of the lesions based on clinical features and physician judgment; Use of other treatments during the study; Very extensive lesions (more than ten centimeters); presence of necrosis and the lesions deeper than hypodermis; Lesions on the face and joints; having a pacemaker and prosthetic; pregnancies.

Health conditions studied

1

Description of health condition studied

Anthroponotic Leishmaniasis

ICD-10 code

B55.1

ICD-10 code description

Cutaneous leishmaniasis

Primary outcomes

1

Description

Lesion healing

Timepoint

Three monthly

Method of measurement

Measuring the size of induration and formidability

Secondary outcomes

1

Description

Side effects

Timepoint

Three monthly

Method of measurement

Efficacy and side effects including local and systemic reactions will be recorded according to patient's report and clinician observation

Intervention groups

1

Description

Thermotherapy: one time (30 seconds at 50 ° C)

Category

Treatment - Other
