The effects of relaxation technique on stress in infertile women who refer to the Esfahan infertility clinic.

Protocol summary

Summary
The purpose of this study was determination of relaxation effect on stress score in the infertile women and pregnancy test as outcome of their treatment. The inclusion criteria included women who were diagnosed with firstly infertility and aged 18 to 35 years. Exclusion criteria included women who were diagnosed with secondary infertility and their aged under 18 and upper 35 years. The study included 76 infertile women that for infertility treatment (IVF, ICSI) was referred to the Isfahan Infertility clinic. At first, the stress score was determined in both groups, by Newton’s infertility stress questionnaire. Stress score was evaluated in participants and then relaxation technique was administered in the intervention group. This technique performed in 12 sessions. All questionnaires were completed under supervision of the researcher after embryo transfer to the uterus (after 2 weeks) and before pregnancy test administering.

**Description**
In the intervention group, in addition to IVF or ICSI treatments, relaxation techniques for 12 sessions (6 sessions before transferring the embryo into the uterus and 6 sessions later) was implemented. For the implementation of this technique, the participants lying down on side, legs slightly bent, the muscles contraction not entered into any combination. Jacobson and Benson technique was used for reduce stress physical and mental. Jacobson techniques or progressive muscle relaxation, as muscle contraction and release of muscles took it. In this way the muscles divided into eight parts and techniques during an active contraction of the muscle for 5 seconds and then release of muscle for 30 seconds stress. The contraction and release of muscles were as follows Right leg; left leg; Right Hand; Left Hand; Abdomen and Lumbar; chest and shoulder; Head and Scalp. Benson technique, concentration to the entry and exit of air to the lungs and the creation of mental imagery. On arrival at the center of the samples, a questionnaire based on stress evaluation, was completed under the supervision of a researcher. These women in seventh day of their menstrual cycle were referred for ultrasound, infertility clinic, the questionnaires were completed at the same time. Relaxation technique for intervention group as a day of eighth, tenth, twelfth, fourteenth, sixteenth and seventeenth cycle will be performed by the researcher. In similar circumstances the previous meetings technique by listening to a CD or tape do. All questionnaires were completed under supervision of the researcher after embryo transfer to the uterus (after 2 weeks) and before pregnancy test administering.

**Category**
Behavior
Description
In the control group treated by IVF or ICSI treatment for patients who were supposed to be the case, the researcher is not doing any additional intervention for these patients.

Category
Treatment - Drugs
