The efficacy of reminiscence therapy of life with emphasis on integrative reminiscence on self-esteem and anxiety in aged male without spouse

Protocol summary

Summary

The aim of this study was to examine the efficacy of reminiscence therapy of life with emphasis on integrative reminiscence on self-esteem and anxiety in aged men without spouse in two experimental and control groups. The main inclusion criteria are: being a widower and lack of physically and mentally chronic diseases. An exclusion criterion is: 3 sessions of absence of the elderly people. The study population included all 60 to 80 year old people of Meshginshahr of whom 34 participants were selected using convenient sampling. They were randomly allocated into two equal groups (experimental and control). Therapy sessions will be conducted on the experimental group in six sessions and each session last 60 minutes. The control group did not receive any intervention. The primary outcomes of the study will include the two variables of self-esteem and anxiety.

Intervention groups

1

Description

The treatment program consisted of 6 sessions which was held once a week for an hour due to the physical circumstances of samples and according to the handbook of interventions. The topics for each session included: 1- Major turning points in life. 2- Family history. 3- Career. 4- History of loves and hates. 5- Stressful experiences. 6- Meaning and purpose of life. Because of using integrative reminiscence, the participants interpreted and assessed the subjects with the help of the therapist at the end of each discussion session and tried to find and give meaning to what the person had experienced and acceptance of negative past experiences and integrate them into the present life.
