Effect of sonohystrography on increasing pregnancy rate in assisted reproductive technology cycle

Protocol summary

Summary

In our study 100 women , who are candidate for ART(assisted reproductive technology) randomly are divided into two groups.In case group SHG (hystrosonogram) is done in midluteal phase before stimulation cycle and in controls only TVS (transvaginal ultrasound) is done then from day 2 or 3 of mense controlled ovarian hyperstimulation with gonadotropin injection is started. Gonadotropin dosage is based on age and ovarian reserve (based on infertility ward protocol) and under TVS control follicular growth monitoring is done. In follicular size of 17-18 mm HCG (human chorionic gonadotropin) 10000 IU is injected and 35-36 h later ovum pick up is done. After 2 or 3 days embryo is transferred . Pregnancy test is requested 2 weeks later, and finally pregnancy rate in two groups is evaluated.

Effect of sonohystrography on increasing pregnancy rate in assisted reproductive technology cycle

Public title

Effect of sonohystrography on pregnancy rate in assisted reproductive technology cycles

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Each women who is candidate for assisted reproductive technology (ART); and agree to participate in this study Exclusion criteria: disagreement with participation in this study; any somatic or psychologic disease

Age

From **20 years** old to **45 years** old

Gender

Female

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: 100

Health conditions studied**1****Description of health condition studied**

Infertility treatment in healthy women

ICD-10 code

z30-z39

ICD-10 code description

Persons encountering health services in circumstances related to reproduction

Primary outcomes**1****Description**

Pregnancy

Timepoint

2 weeks after embryo transfer

Method of measurement

Pregnancy test

Secondary outcomes

empty

Intervention groups**1****Description**

In case group hysterosonogram with normal saline is done in midluteal phase before stimulation cycle. Then ovarian stimulation with gonadotropins is started from day 2-3 of cycle and with TVS (transvaginal ultrasound) follicular growth is monitored, in follicular size 17-18 mm HCG (human chorionic gonadotropin) 10000 IU inject and 35-36 h after that ovarian puncture is done. 2-3 day later embryo transfer is done and 14 days later pregnancy test is requested.

Category

Other

2**Description**

In controls in this time (mid luteal phase) transvaginal ultrasound is done and other steps are like case group.
