The effect of hysteroscopy on Successful pregnancy in IVF in the infertile women who are candidate for the first IVF cycle

Protocol summary

Summary

This is a randomized control clinical trial study, which study the effectiveness of hysteroscopy in the first IVF. Patients who have inclusion criteria (Age less than 38 years, 35 > BMI, didn't do Hysteroscopy in two past month, Absence of uterine and tubal pathology which is incurable by Hysteroscopy, couples undergoing ART with their own gametes). Patients who are referred to Shariati Hospital, will be selected for this study. The number of participants are 220. Patients randomly will be divided into two groups of 110. For both groups Long Protocol will begin. Group 1: within 14 days prior to IVF, hysteroscopy will be done and if they have pathology in uterine will be corrected in that time. Group 2: include 110 individuals who will not do hysteroscopy before IVF. Two weeks after IVF, beta- hcg will be checked and then two weeks later, ultrasound examination to diagnose EP, miscarriage, multiple poles, embryonic and fetal heart. the results We will be compared by each others .results will be analyzed by SPSS software.

Health conditions studied

1

Description of health condition studied

Infertility

ICD-10 code

N97.9

ICD-10 code description

Female infertility, unspecified

Primary outcomes

1

Description

Chemical pregnancy

Timepoint

Two week after IVF

Method of measurement

Check β HCG

Secondary outcomes

1

Description

Clinical pregnancy

Timepoint

4 week after IVF

Method of measurement

Vaginal sonography

Intervention groups

1

Description

In the control group: no intervention will be done

Category

N/A

2

Description

In the intervention group, hysteroscopy is performed within 14 days prior to in vitro fertilization and If there is an abnormality in the uterine cavity , we will correct that,at the same hysteroscopy

Category

Treatment - Surgery
