Efficacy of combining variuse anesthesia technique in success rate of anesthesia in first mandibular molar with irreversible pulpitis

Protocol summary

Summary

This study was to compare the success rate of using both an IAN block and a buccal infiltration and periodontal injection with that obtained by using an IAN block alone for endodontic treatment of mandibular teeth with irreversible pulpitis. In a randomized double-blinded clinical Trial, eighty-six patients were randomly assigned to 2 groups of 43 patients each. The exclusion criteria are the presence of systemic disorders, a sensitivity to lidocaine with 1:80,000 epinephrine, a sensitivity to NSAIDs and the Inclusion criteria included healthy patients having a first mandibular molar tooth with irreversible pulpitis and normal periapical radiographic appearance. Lidocaine 2% with 1:80,000 epinephrine was used for all injections. Group I patients received an IAN block with 3.6 mL of anesthetic. Group II patients received 1.8 mL as an IAN block and 1.8 mL as a buccal infiltration and after 15 minuets received 0.9 ml periodontal injection . A visual analogue scale was used to rate pain before anesthesia and discomfort experienced before and during access cavity preparation. Data were analyzed by Tow way repeated measure ANOVA, multivariate logistic regression.

General information

Acronym

Inferior alveolar nerve blok (IANB)

IRCT registration information

IRCT registration number: **IRCT138901072016N4**

Registration date: **2012-05-13, 1391/02/24**

Scientific title

Efficacy of combining variuse anesthesia technique in success rate of anesthesia in first mandibular molar with irreversible pulpitis

Public title

Efficacy of combining variuse anesthesia technique in success rate of anesthesia in inflammed posterior tooth of mandible

Purpose

Treatment

Inclusion/Exclusion criteria

The exclusion criteria were the presence of systemic disorders, a sensitivity to lidocaine with 1:80,000

epinephrine, a sensitivity to NSAIDs, the presence of widening of the periodontal ligament space, the presence of a periapical radiolucency, lactation, pregnancy. Inclusion criteria included healthy patients having a first mandibular molar tooth with irreversible pulpitis and normal periapical radiographic appearance, without spontaneously pain that to be needed emergency treatment.
