Comparing intramuscular and intranasal Ketamin in pain reduction of pediatrics between 2 and 15 years during procedural sedation in emergency department

Protocol summary

Summary

Object: Comparing the effect of intranasal Ketamin with intramuscular Ketamin in decreasing the pain in pediatric patients. Methods and Material: The above study is a double blind and randomized clinical trial which will be accomplished on 60 children aging 2 to 15 years, with the same physical conditions and same circumstances admitted in Tehran Hazrate Rasoul Hospital. The patients admitted according to the criterion of the study will be randomly divided in one of two groups of the study; Interventions: It means 30 patients will be considered for each group. For group one, one to two milligrams per kilogram of intramuscular Ketamin and for the second group one to two milligrams per kilogram of intranasal Ketamin will be administered. The children will be evaluated before, during and after drug administration using pain evaluation scales for children and also the level of their satisfaction and the results will be documented. Inclusion Criteria: Necessity to perform different types of procedures including repair of lacerations in different sizes and in every region of body and also types of reductions in emergency department; Level of consciousness more than 15 in GCS format; Age between 2 and 15; Not suffering of any mental disorders; Consent of the patient for the procedures. Exclusion Criteria: Any past history of surgery on trachea or tracheal stenosis; Active lung infection; Intake of large amount of food during three hours before procedure; Cardiovascular diseases including angina and heart failure and hypertension; Trauma or head injury resulting in lowering level of consciousness or vomiting; Mass in CNS or hydrocephalus; Not well controlled seizure ; Glaucoma or Acute globe injury; Psychosis and Porphyria and Thyroid Disease and treatment with drugs of thyroid disease; Cardiac complications due to Ketamin administration; Not having consent of parents and guardians or the patient himself. Primary Outcome

Value: evaluation of pain in different intervals: before, during and after drug administration using pediatric pain scales.

Health conditions studied**1****Description of health condition studied**

Extremity Trauma

ICD-10 code

XIII

ICD-10 code description

Musculoskeletal System and Connective Tissue Diseases

Primary outcomes**1****Description**

Pain Severity

Timepoint

Before, during and after drug administration

Method of measurement

Administration of Visual Analogue Scale and asking the patient to determine the picture representative of pain severity

Secondary outcomes**1****Description**

changes in Vital Signs and Side effects

Timepoint

Before, during and after drug administration

Method of measurement

According to history and physical examination

Intervention groups

1

Description

Intervention Group: Nasal spray of 1-2 mg/kg of Ketamin

Category

Treatment - Drugs

2

Description

Control Group: Intramuscular injection of 1-2 mg/kg Ketamin

Category

Treatment - Drugs
