The Effect of Home-based Rehabilitation Ttraining on Pain, Performance, General Health and Quality of Life in Patients with Knee Osteoarthritis

Protocol summary

Summary

Objective: The effect of home-based rehabilitation training on pain, performance, general health and quality of life in patients with knee osteoarthritis Methodology: This is an experimental study. Samples of this study were 74 patients who conformed to the inclusion criteria (no history of surgical-related disease, having radiological symptoms of osteoarthritis in knee with a physician's approval, and non-use of an intra-articular injectable drug). They were selected among all patients with knee osteoarthritis referring to the clinic Nos. 2 of Persian Gulf Bushehr from 2017/10/23 to 2018/02/20. They were assigned to two intervention and control groups by randomized blocking method. Research intervention for each intervention group was three 1-hour training sessions that took place individually and face-to-face over the course of 3 consecutive days and follow up was continued for two months after home-based training but it was not given to the educational control group. Pain, performance, general health and quality of life in both groups before and after two months of intervention were measured using a visual analog scale of pain, a questionnaire, a general health questionnaire, and a (SF-12) questionnaire. Data analysis was done by descriptive statistical tests and at a significant level of 95%. Outcome: Rehabilitation training by nurses, as an inexpensive, accessible and effective intervention at home, is expected to be an effective step in reducing pain, improving performance, general health and quality of life in patients with knee osteoarthritis.

Scientific title

The Effect of Home-based Rehabilitation Ttraining on Pain, Performance, General Health and Quality of Life in Patients with Knee Osteoarthritis

Public title

The Effect of Home-based Rehabilitation on the Treatment of Knee Qsteoarthritis

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria: No history of surgical related disease (such as joint replacement, joint repair), having radiological symptoms of osteoarthritis in knee with a physician's approval, non-use of an intra-articular injectable drug, the absence of any mental and psychological illness according to the patient's own statements, and independence in self-care. Exclusion criteria: The first referral of the patient and the lack of diagnosis by the doctor, the lack of regular referral of the patient, the patient's reluctance to continue treatment, and exacerbation of symptoms.

Intervention groups

1

Description

"Intervention group: Implementation of three 1-hour sessions "Individual training and practice in the following order: The first training session on knee osteoarthritis,

the causes of symptoms, symptoms, and a simple language diet for one hour is explained. The second session is about the pharmaceutical diet, proper sitting and lifting, and the patient is asked to practice in the presence of the researcher in order to ensure that it is accurate. The third session is about exercising and Range of Motion (ROM) exercises, and the patient is required to perform exercises in the presence of a researcher in order to ensure that it is accurate. Also, a review of the two sessions is done and the questions are answered to the patient and will be provided to the patients at the end of the session on the educational curriculum related to the training sessions. The patient is then asked to repeat the stretching exercises on a daily basis and how to sit up and get up and keep up-to-date, and complete all the training tips and exercises for two months, and a checklist of hints and exercises that should be done throughout the day. He will be given a mark on them. The checklist is also available to the researcher, and the researcher will contact the patient once a week to ensure that he or she is practicing and observing educational issues".
