The comparison of the effects of Micosin vaginal cream and Metronidazole vaginal gel on treatment of bacterial vaginosis

Protocol summary

Summary

The purpose of this randomized controlled trial is to compare the effect of vaginal garlic, thyme and Metronidazole creams in fungal treatment. The study will be performed on all women with vaginosis bacterial symptoms who refer to a clinic associated with Shiraz University of Medical Sciences. The researcher will first ask the patient to fill a consent form and then complete the initial questionnaire that contains questions about demographic and fertility. Also, the check list of vaginosis bacterial detection will filled by examination and interview. Vaginal discharge Amesel test will be sent to medicine laboratory for review. Finally, 120 women with positive Amsel test and positive secretion culture for vaginal bacterial and negative secretion culture for Candidiasis and Trichomonas will be chosen. Then, using a table of random numbers computed by randomized block permutation, they will be divided into two groups, A and B. Women in group A, will take medicine A and women in group B will take medicine B. A week after the treatment, all the patient will be interviewed and samples will be taken and the vaginal samples will be analyzed using Amsel subculture method to assess clinical improvement.
