Iranian Registry of Clinical Trials

07 Jun 2026

Effect of *Salvia officinalis* Tablet on lipid profile and quality of life in postmenopausal women

Protocol summary

Study aim

The effect of sage on serum lipids and quality of life in postmenopausal women

Design

Clinical trial with control group, with parallel groups, double-blind, randomized by permutation method

Settings and conduct

The researcher-made demographic information questionnaire and the quality of life questionnaire of postmenopausal women are completed by the researcher. The samples are controlled for serum lipids, including cholesterol, triglycerides, LDL and HDL. They are then intervened with medication or placebo for 8 weeks. The intervention is in the form of oral tablets of 100 mg of sage extract or placebo three times a day. At the end of 8 weeks, the questionnaire of quality of life of postmenopausal women is completed again by the researcher and the tests are repeated, and the results are compared and statistically analyzed. Will be located. The study site is health centers in Shiraz.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Menopausal women between the ages of 45-60, without any serious physical or mental illness, without any use of hormonal drugs, with body mass index less than 29, no smoking, no allergies. Exclusion criteria: use of hormonal drugs, beta-blocker, thiazide, allergy, use of any drug that affects menopause, blood lipid level more than 300mg

Intervention groups

After obtaining informed consent and providing the necessary explanations, 100 mg oral sage extract tablets were prescribed daily for the intervention group and placebo for the control group.

Main outcome variables

Quality of life, serum lipids

Scientific title

Effect of Salvia officinalis Tablet on lipid profile and quality of life in postmenopausal women

Public title

The effect of Salvia officinalis on lipid profile and quality of life in postmenopausal women

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age between 45 and 60 years Menstruation in the past year Conscious written consent No known physical or mental illness Do not take any hormonal medications to reduce menopausal symptoms in the past month Do not take lipid-lowering drugs BMI below 29 No history of allergy to herbal medicines No smoking, hookah or drug addiction

Exclusion criteria:

Age

From **45 years** old to **60 years** old

Gender

Female

Phase

2-3

Groups that have been masked

- Participant
- Care provider
- Investigator
- Outcome assessor

Sample size

Target sample size: **102**

Actual sample size reached: **100**

Randomization (investigator's opinion)

Randomized

Randomization description

The population of eligible women is randomly assigned to two groups using a random permutation block design. The groups are placed and if the numbers 5 to 9 are observed, two people are placed in two groups as BA permutations and we repeat this until we have 51 people in each group. Thus, the samples are divided into two groups A (drug group A) and group B (group consuming drug B) are divided. Women are also informed that they will be accidentally placed in one of the groups.

Blinding (investigator's opinion)

Double blinded

Blinding description

This study is a double-blind study and the patient and the researcher are not aware of receiving sage and placebo, and both are prepared by the Faculty of Pharmacy and will be provided to the patient with a code. After completing the research, the type of intervention will be determined with codes.
