Investigation of efficacy rate of prophylactic treatment with oral paracetamol for closure of patent ductus arteriosus in preterm infants admitted in neonatal intensive care unit

Protocol summary

Summary

The aim of the study is investigating the efficacy rate of prophylactic treatment with oral paracetamol for closure of patent ductus arteriosus in preterm infants. Inclusion criteria is premature neonates born at or before 32 weeks of gestation with birth weight less than or equal to 1500 grams and exclusion criteria is congenital major anomalies or chromosomal abnormalities. This interventional study will performed in premature newborns who admitted in neonatal intensive care unit of Vali-e-Asr Hospital in 2012-2013. Since thus far no studies have been conducted about the efficacy of acetaminophen for closure of patent ductus arteriosus, so 30 subjects are evaluated in this study. Subjects are randomly divided into 2 groups at beginning of admission. For the first group during first 24 hours after birth 15mg/kg oral acetaminophen will administrated every 6 hours for 48 hours. Echocardiography will performed for them during 24-36 hours after the last dose of acetaminophen by a pediatric cardiologist to evaluating of ductus arteriosus. Echocardiography of newborns in second group will also performed during 4-5 days old without any intervention by the same specialist to evaluate ductus arteriosus.

Scientific title

Investigation of efficacy rate of prophylactic treatment with oral paracetamol for closure of patent ductus arteriosus in preterm infants admitted in neonatal intensive care unit

Public title

The efficacy of prophylactic treatment with oral acetaminophen for closure of patent ductus arteriosus in preterm infants

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Premature neonates born at or before 32 weeks of gestation with birth weight less than or equal to 1500 grams admitted in neonatal intensive care unit of Vali-e-Asr Hospital in 2012; parental consent for participating in this study. Exclusion criteria: Newborns with congenital heart defects that patency of ductus arteriosus is vital for them such as pulmonary atresia; congenital major anomalies or chromosomal abnormalities; maternal consumption of none steroidal anti-inflammatory drugs during pregnancy; newborns with hydrops fetalis or persistent pulmonary hypertension of the newborn; apgar score less than 5 at fifth minute after birth; appearance of patent of ductus arteriosus symptoms and requirement for treatment with Ibuprofen at any time; having vomiting or hematemesis during first 3 days after birth; neonates with glucose-6-phosphate dehydrogenase deficiency based on blood exam at beginning of neonatal admission
