Evaluation of autologous bone marrow stem cells transfusion in treatment of cirrhotic, in decompensated cirrhotic patients

Protocol summary

Summary

Objectives: To evaluate the effect of bone marrow stem cell injection in the peripheral vein on the treatment of decompensated cirrhotic patients. Design: Interventional, randomized, non-blinded design Target sample size: Twenty patients suffering from liver cirrhosis, waiting for liver ransplant. Major inclusion criteria: Age range of 18 to 60 years; Having cirrhosis, based on clinical symptoms and laboratory, endoscopic and radiological findings; Being a candidate for liver transplant. Major exclusion criteria: Concurrent diseases such as heart, kidney, and pulmonary conditions; Presence of a hepatic mass indicating hepatocellular carcinoma, according to radiological findings. Intervention: Stem cells (120-200 CC) are injected in patients with liver cirrhosis, using special filters to collect fat particles, possible clots and other particles during one hour. Setting and conduct: Bone marrow aspiration is generally performed to obtain bone marrow cells. After collecting 120 cc of bone marrow cells, the number and percentage of nucleated cells are determined by a laboratory expert. Aspiration continues until the total number of nucleated cells reaches the minimum acceptable threshold of about 10 (9)*1. Then, the total volume of aspirated bone marrow cells is injected in patients with liver cirrhosis, using special filters to collect fat particles, possible clots, and other particles over one hour. Main outcome measures: Laboratory tests (albumin, hemoglobin and blood clotting tests) were carried out once a week after the intervention for a period of two week by blood test.

Scientific title

Evaluation of autologous bone marrow stem cells transfusion in treatment of cirrhotic, in decompensated cirrhotic patients

Public title

Treatment of cirrhotic of liver

Purpose

Treatment

Inclusion/Exclusion criteria
 Inclusion criteria: Age range of 18 to 60 years; Having cirrhosis, based on clinical symptoms and laboratory, endoscopic and radiological findings; Being a candidate for liver transplant. Exclusion criteria: Concurrent diseases such as heart, kidney, and pulmonary conditions; Presence of a hepatic mass indicating hepatocellular carcinoma, according to radiological findings; Extrahepatic malignancies; Moderate to severe hepatic encephalopathy; HIV positive; Presence of malignancies; Activated hepatic vein thrombosis, spleen and portal venous; Concurrent extrahepatic infections; Active venous bleeding; History of alcohol consumption; Lack of patient's consent

Age
 From **18 years** old to **60 years** old

Gender
 Both

Phase
 2

Groups that have been masked
No information

Sample size
 Target sample size: **20**

Randomization (investigator's opinion)
 Randomized

Randomization description

Blinding (investigator's opinion)
 Not blinded

Blinding description

Placebo
 Not used

Assignment
 Parallel

Other design features
 20 People, via lottery, were selected between patients who were candidate to waiting for Liver Transplant

Health conditions studied

1

Description of health condition studied

Cirrhotic of liver

ICD-10 code

K76.1

ICD-10 code description

Chronic passive congestion of liver

Primary outcomes

1

Description

MELD score

Timepoint

Every week after the intervention for two weeks

Method of measurement

Calculating by algorithm formula.

2

Description

Laboratory tests (albumin, hemoglobin and blood clotting tests)

Timepoint

once a week after the intervention for a period of two week

Method of measurement

Blood test

3

Description

Child score

Timepoint

Every week after the intervention for two weeks

Method of measurement

Calculating by algorithm formula.

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Stem cells (120-200 CC) are injected in patients with liver cirrhosis, using special filters to collect fat particles, possible clots and other particles during one hour.

Category

Treatment - Other

2

Description

Control group: Patients with liver cirrhosis, not receiving

stem cells, were allocated to the control group.
