Comparison of efficacy of application viable BCG vaccine paste versus placebo in the treatment of common wart: a double-blind and randomized placebo-control clinical trial

Protocol summary

Summary

Comparison of efficacy of application viable BCG vaccine paste in the treatment of common wart versus placebo: a double-blind and randomized placebo-control clinical trial. Abstract: Treatment of verrucae is difficult and may be painful or scaring especially by using traditional destructive methods . The aim of current study is evaluation of the efficacy and safety of topical application of viable Bacillus Calmette-Guerine (BCG) in the form of paste as a new and safe immunotherapeutic modality in treatment of common warts. Method and material: This double blind randomized clinical trial study is carried out in patients who were divided into two groups: patients in case group (40 patients) receive topical BCG paste (BCG+salicylic acid +glycerin) and patients in control group (40 patients) receive placebo (salicylic acid+glycerin) with similar shape and color of the BCG paste. Treatment protocols in two groups are topical weekly application for 8 consecutive weeks. patients who have no response in both group will be treat by cryotherapy. Follow up will be done every 2 weeks during treatment and 8 weeks after the end of treatment for evaluation of recurrence .

Scientific title

Comparison of efficacy of application viable BCG vaccine paste versus placebo in the treatment of common wart: a double-blind and randomized placebo-control clinical trial

Public title

Treatment of common wart with topical BCG vaccine

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: patients with common wart without any limitation on patients age; patients sex; wart numbers;

distribution of lesions; duration of disease. Exclusion criteria: any treatment in the 3 months ago; no BCG immunization; no immune deficiency due to drug or chronic disease; hypersensitivity to BCG; presence of febrile disease; chronic disease induced immunodeficiency such as diabetes melitus; presence of allergic skin disease such as urticaria.

Age

From **1 year** old to **70 years** old

Gender

Both

Phase

2-3

Groups that have been masked

No information

Sample size

Target sample size: **40**

Intervention groups

1

Description

interventional group: in this group 40 patients treat with topical BCG weekly for 8 consecutive week. 1 cc BCG and 3cc glycerin combine and apply on warts. dress with plastic and wash after 2 hours. patients evaluate every 2 week for complications, response to treatment and photography. patients also evaluate for recurrence 8 week after end of treatment. cryotherapy will be done if not response to BCG.
