Effect of self-care education with multimedia method on quality of life in burned patients

Protocol summary

Summary

This study is a randomized controlled clinical trial. The intervention will be self-care education (activity and exercise, activity of daily life, care of burned and healed locations of the body, diet, and medications) with CD that will be conducted before patients discharged. Its effect on quality of life will be measured after 3 and 6 months with standardized questionnaire for assessing burn specific health scale-brief. Sample size will be 110 burned patients and participants will be allocated in two groups randomly. Patients in control group will receive routine care. Inclusion criteria are included: patients with 10-45% burn percentage and 1, 2, and 3 burn degree. An exclusion criterion is deterioration of patients' condition. Before patients discharge, an education session with showing content of CD in a lab top and answer/question method for 30 minutes will be done by a co-researcher in a suitable place.
