The Effect of Benson's relaxation on anxiety and physiological parameters on candidate of open heart surgery patients in selected hospitals of AJA University Medical Science.

Protocol summary

Summary

This study is a clinical trial was performed on 90 patients undergoing open heart surgery. The main inclusion criteria included aged 20 to 70 years old; Absence of trouble hearing; Unfamiliarity with the same periods with Benson's relaxation in the experimental and control groups; Absence of musculoskeletal system disorder; The ability to communicate in Persian language; The ability to taking Benson's relaxation training; Absence of contraindications to control blood pressure and pulse of the right hand and The main exclusion criteria Included unwillingness to continue cooperation in the study at any time of the study. Data collection instruments included a demographic questionnaire, and the Spielberg's anxiety inventory. The patients were randomly assigned into two experimental and control groups. Anxiety levels in two groups the day before surgery measuring by questionnaire Spielberg's anxiety and then in the experimental group were trained Benson's relaxation. In the morning of surgery, Benson's relaxation were performed by the experimental group and then anxiety levels and physiological parameters control and evaluation in both groups about half an hour before was sent to the operating room. Finally data analyzed was performed.
