Effect of yoga on women with generalized anxiety disorder

Protocol summary

Summary

In this study, 40 women referred to Psychiatric clinics of Tabriz University of Medical Sciences and were interviewed and asked to complete SADS and Spielberger questionnaires. They were diagnosed with generalized anxiety disorder and after considering the inclusion and exclusion criteria enrolled in this study after filling the written informed consent form. Then, the patients were randomly assigned into control or intervention group. Participants received the usual prescribed drug by their physician. The two groups were matched regarding age, severity of anxiety, and drug dosage. The intervention group was given yoga instruction (Hata yoga method) by a trained yoga instructor twice a week for 10 sixty minutes sessions for 6 weeks. The control group was recommended to watch the favorite movie on TV on the similar occasion to the intervention group. Finally, Spielberger questionnaires were filled and the results were compared between groups.
