Comparing of plasma blood sugar between patients undergoing elective cesarean section under general or spinal anesthesia

Protocol summary

Summary

Surgery and pain are associated with stress response that lead to increase in stress hormones such as norepinephrine, epinephrine, etc. These hormones may stimulate gluconeogenesis and increment in blood sugar. It seems general or spinal anesthesia may reduce the stress response due to surgery, thus we aimed to compare between the effects of these two ways on blood glucose. This study was a single blind randomized clinical trial scheduled on 60 patients with American society anesthesia physical classification system (ASA) 1 or 2. In this study blood glucose was measured before operation as a baseline glucose, intraoperative and at 2, 12, 24 hours from end of the surgery then the data in each hour from one patient subtract from preoperative data of him or herself. These differences in any times were compared between patients undergoing cesarean under general or spinal anesthesia

Scientific title

Comparing of plasma blood sugar between patients undergoing elective cesarean section under general or spinal anesthesia

Public title

Comparing of plasma blood sugar between patients undergoing elective cesarean section under general or spinal anesthesia

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: all woman with the age range between 20 to 50 who has been scheduled for elective cesarean section surgery under general or spinal anesthesia.

Exclusion criteria: diabetes mellitus; history of corticosteroid therapy; recent oxytocin administration; history of addiction; history of gestational diabetes mellitus; history of preeclampsia.

Age

From **20 years** old to **50 years** old

Gender

Female

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **60**

Randomization (investigator's opinion)

Health conditions studied

1

Description of health condition studied

General anesthesia,spinal anesthesia

ICD-10 code

Y84.8

ICD-10 code description

Other medical procedures

Primary outcomes

1

Description

Changes in serum levels of blood sugar

Timepoint

Intraoperative, postoperative, 2 hours after surgery, 12 hours after surgery and 24 hours after surgery

Method of measurement

In milligrams per deciliter of glucometer

Secondary outcomes

1

Description

Blood pressure

Timepoint

Intraoperative, postoperative, 2 hours after surgery, 12 hours after surgery and 24 hours after surgery

Method of measurement

Manometer

Intervention groups

1

Description

general anesthesia

Category

N/A

2

Description

spinal anesthesia
