Clinical trial of the effect of Pilates exercise on the happiness of elderly women over 60 years old

Protocol summary

Summary

The aim of this study is to investigate the effect of Pilates exercise on the happiness of elderly women referring to Rafsanjan Health Center. This study will be done as a Randomized Clinical Trial. The studies population are women aged over 60 years old. After completing the demographic information, the happiness status of the person will be measured using the Oxford Happiness Questionnaire (OHQ) completed by the researcher. According to the score of the OHQ, 56 people who had a low to moderate happiness score (score less than 44) were selected and randomly divided in two intervention and control groups (28 per group). The inclusion criteria's are women age over 60 years old, ability to do daily routines, lack of motor-psychological disorders and do not have drug addiction. Elderly who does not attend more than three sessions in the exercise will be excluded. The study intervention is Pilates Stoke exercise that conducted for 8 weeks, 3 sessions in a week. Duration of each session will be 1 hour. The exercise will be done in the morning under the supervision of experienced coach. Each training session includes three stages, including warming up, Pilate's exercises and a return to initial stage. The control group does not receive any intervention. The outcome is the status of women's happiness.
