Comparison of motor-cognitive dual task training and virtual reality based training effects on the anticipatory postural adjustments in older adults

Protocol summary

Summary

The main purpose of this study is to find which type of treatment (cognitive-motor intervention or virtual reality method) is more effective to improve the postural control of older adults. It is estimated 20 healthy older adults are sufficient for this study. The inclusion criteria for healthy older adults are the following: Age ≥ 65 years old, be free from any severe cardiopulmonary disease, neurological disorder, musculoskeletal impairment or any history of falls in the prior 6 months. Subjects are excluded from either group if had any dizziness, fatigue, vigorous physical activity or stress before testing. After baseline evaluation, subjects are randomly allocated to one of the two groups: (1) cognitive-motor dual-task training, (2) virtual reality based training. Cognitive-motor dual-task training is balance training while simultaneously engaging in a secondary cognitive task. Virtual reality based training is balance training in a virtual environment using programs of Wii fit. Participants in these groups are attended 12-16 sessions, 3 sessions per week, and 60 minutes per session. The outcome measurements take place at 3 time points: (1) before initiation of intervention (baseline), (2) after completion of training, (3) 8 weeks after completion of training. The outcome measurements are displacement and velocity of center of pressure, CNV peak amplitude, CNV peak time, amplitude of Late CNV, time to activity onset of muscles, and functional tests.

Scientific title

Comparison of motor-cognitive dual task training and virtual reality based training effects on the anticipatory postural adjustments in older adults

Public title

Comparison of motor-cognitive dual task training and

virtual reality based training effects on the anticipatory postural adjustments in older adults

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria: Age ≥ 65 years old; BBS score >40; TUG score ≤20; ABC score ≥50%; MMSE score ≥24; HADS- depress subscale score ≤7; Have no severe cardiopulmonary disease, neurological disorder, and musculoskeletal impairment; Have no history of falls in the prior 6 months. Exclusion criteria: had vigorous physical activity before testing; had dizziness, fatigue, and stress during testing

Age
From **65 years** old

Gender
Both

Phase
N/A

Groups that have been masked
No information

Sample size
Target sample size: **20**

Randomization (investigator's opinion)
Randomized

Health conditions studied

1

Description of health condition studied
elderly

ICD-10 code
R54, G31.1

ICD-10 code description
senility NOS, Senile degeneration of brain, not elsewhere classified

Primary outcomes

1

Description
Displacement of center of pressure

Timepoint
before training, after completion of training, 8 weeks after completion of training

Method of measurement
force plate

2

Description
Velocity of center of pressure

Timepoint
before training, after completion of training, 8 weeks after completion of training

Method of measurement
force plate

3

Description
CNV Peak amplitude

Timepoint
before training, after completion of training, 8 weeks after completion of training

Method of measurement
Micrommed

4

Description
CNV Peak time

Timepoint
before training, after completion of training, 8 weeks after completion of training

Method of measurement
Micrommed

5

Description
Time to activity onset of muscles

Timepoint
before training, after completion of training, 8 weeks after completion of training

Method of measurement
Biometrics DataLog

6

Description
amplitude of Late CNV
Timepoint
before training, after completion of training, 8 weeks after completion of training
Method of measurement
Micrommed

7

Description
BBC score
Timepoint
before training, after completion of training, 8 weeks after completion of training
Method of measurement
Questionnaire

8

Description
TUG time
Timepoint
before training, after completion of training, 8 weeks after completion of training
Method of measurement
Timmer

9

Description
ABC score
Timepoint
before training, after completion of training, 8 weeks after completion of training
Method of measurement
Questionnaire

10

Description
TMT (A,B) score
Timepoint
before training, after completion of training, 8 weeks after completion of training
Method of measurement
Questionnaire and timmer

Secondary outcomes

empty

Intervention groups

1

Description
Balance training in a virtual environment using programs of Wii fit. Participants in this group are attended 12-16 sessions, 3 sessions per week, and 60 minutes per session.
Category
Behavior

2

Description
Balance training while simultaneously engaging in a secondary cognitive task. Participants in this group are attended 12-16 sessions, 3 sessions per week, and 60 minutes per session.
Category
Behavior
