Clinical trial comparison of sedation and hemodynamic effects between propofol and etomidate in urological patients

Protocol summary

Summary

Objectives: In this study the effects and complications of propofol and etomidate in patients with urological surgeries will be investigated. Design: Randomized single blind Setting and conduct: 177 patients within 50 year's old or more who has minor urologic surgeries will be divided in 2 groups receiving propofol and Etomidate. Major Inclusion and Exclusion criteria: Patients with ambulatory elective urological surgery with age more than 50 will be included and patients with history of adrenal insufficiency and history of allergy to the Etomidate or Propofol will be excluded. Intervention: Injection of Etomidate or Propofol main outcome measures: pain relief and hemodynamic instability

Scientific title

Clinical trial comparison of sedation and hemodynamic effects between propofol and etomidate in urological patients

Public title

comparison of sedation between propofol and etomidate in patients with elective urological surgery

Purpose

Treatment

Inclusion/Exclusion criteria

inclusion criteria: patients with ambulatory elective urological surgery; age more than 50; ASA class I , II
exclusion criteria: history of adrenal insufficiency; history of vital sign instability; history of allergy to the Etomidate or Propofol

Age

From **50 years** old to **90 years** old

Gender

Both

Phase

2-3

Groups that have been masked

No information

Sample size

Target sample size: 177

Randomization (investigator's opinion)

Randomized

Randomization description

Blinding (investigator's opinion)

Single blinded

Blinding description

Placebo

Not used

Assignment

Parallel

Other design features

Patients divided to the 2 groups by table of random numbers .

Health conditions studied

1

Description of health condition studied

urological disease

ICD-10 code

N21.1

ICD-10 code description

Calculus in urethra

Primary outcomes

1

Description

sedative effects

Timepoint

every 5 minute until 30 minute

Method of measurement

questionnaire

Secondary outcomes

1

Description

vital signs

Timepoint

every 5 minute until 30 minute

Method of measurement

questionnaire

Intervention groups

1

Description

Etomidate will be injected intravenously by dose of 0.1 mg/kg, when inadequate response another 0.05 mg/kg will be injected

Category

Treatment - Drugs

2

Description

Propofol will be injected intravenously by dose of 1 mg/kg, when inadequate response another 0.5 mg/kg will be injected

Category

Treatment - Drugs
