Comparison of oral Betahistine and intramuscular promethazine in treatment of acute peripheral vertigo in emergency department

Protocol summary

Summary

Background: acute peripheral vertigo is a common complaint in emergency department and oligoanalgesia is a known phenomenon due to staff involvements and the chaotic environment of emergency department. Thus oral forms of drugs are the preferred forms in emergency departments. This trial compares the efficacy and safety of oral betahistine and intramuscular promethazine in adult patients presenting in an academic emergency department. Participants: Inclusion criteria are patients 18-65 years old with peripheral acute vertigo. Exclusion criteria are contraindications of promethazine and betahistine; pregnant and breast feeding women, central vertigo. Intervention: First group will receive Betahistine and intra muscle (IM) placebo and second group will receive oral placebo and IM promethazine. Outcome: Symptom relief will be recorded in 0 and 4 hours after treatment and side effects will be recorded after 4 hours in both groups.

Health conditions studied

1

Description of health condition studied

Acute peripheral vertigo

ICD-10 code

VIII

ICD-10 code description

Diseases of the ear and mastoid process

Primary outcomes

1

Description

Symptom control

Timepoint

0, 1, 2 and 4 hours after treatment

Method of measurement

VAG score

Secondary outcomes

1

Description

Occurance of drug side effects

Timepoint

During the first 4 hours

Method of measurement

Monitoring the patient

Intervention groups

1

Description

Betahistine 8 mg as treatment and stilled water 2 ml as placebo was given to first group

Category

Treatment - Drugs

2

Description

Promethazine 25 mg intramuscle and oral placebo was given to second group

Category

Treatment - Drugs
